## **n-person** Session 8

#### March 2, 2023

PMAP 8521: Program evaluation Andrew Young School of Policy Studies

### **Plan for today**

Models vs. designs

#### Interactions and regression

#### Simple diff-in-diff

#### **Two-way fixed effects**

### **Two quick things**

### Chunk names

### **Correct SEs for IPW**

## Models vs. designs

#### Da∨id Card

#### Joshua Guido D. Angrist W. Imbens

"for his empirical contributions to labour economics" "for their methodological contributions to the analysis of causal relationships"

THE ROYAL SWEDISH ACADEMY OF SCIENCES

#### The effect of increasing the minimum wage

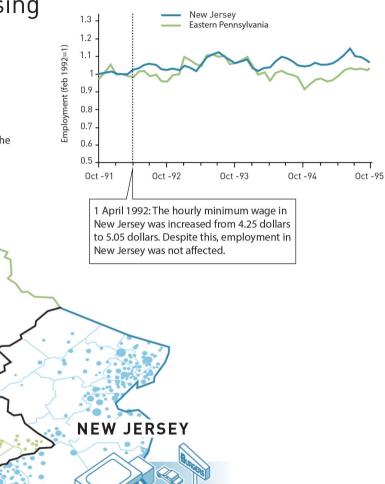

Card and Krueger used a natural experiment to study how increasing the minimum wage affects employment.

The researchers identified a treatment group (restaurants in New Jersey) and a control group (restaurants in eastern Pennsylvania) to measure the effect of increasing the minimum wage.

TREATMENT GROUP

PENNSYLVANIA

CONTROL GROUP

### Design-based vs. model-based inference

#### Special situations vs. controlling for stuff

## How would you know when it is appropriate to use a quasi-experiment over an RCT?

### **Identification strategies**

The goal of *all* these methods is to isolate (or **identify**) the arrow between treatment  $\rightarrow$  outcome

**Model-based identification** 

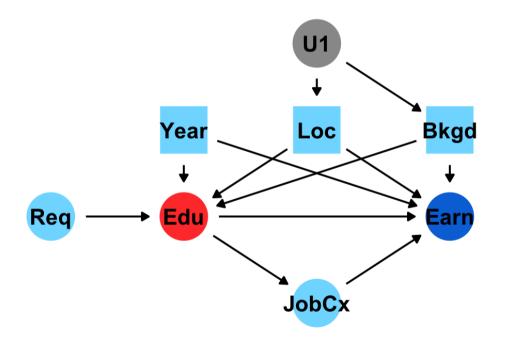

**Design-based identification** 

Randomized controlled trials Difference-in-differences

**Regression discontinuity Instrumental variables** 

### **Model-based identification**

#### Use a DAG and *do*-calculus to isolate arrow

#### Core assumption: selection on observables

Everything that needs to be adjusted is measurable; no unobserved confounding

**Big assumption!** 

This is why lots of people don't like DAG-based adjustment

#### Prince Charles King

- Male
- Born in 1948
- Raised in the UK
- Married twice
- Lives in a castle
- Wealthy & famous

#### Ozzy Osbourne

- Male
- Born in 1948
- Raised in the UK
- Married twice
- Lives in a castle
- Wealthy & famous

### **Design-based identification**

#### Use a special situation to isolate arrow

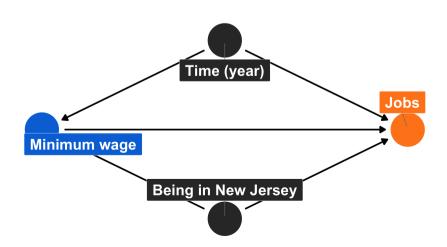

Use randomization to remove confounding

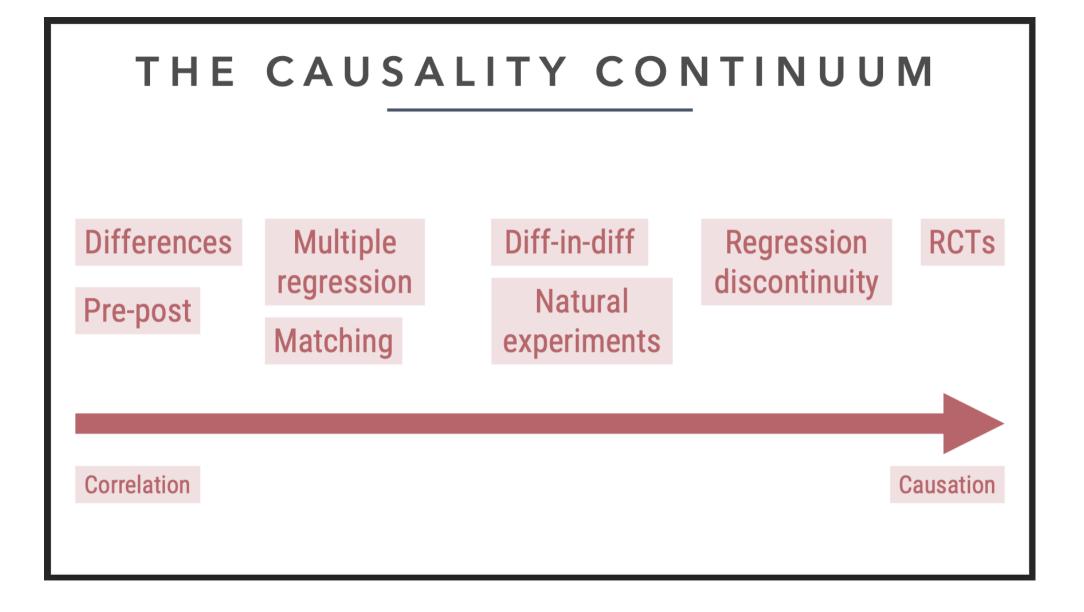

Υ

#### **Difference-in-differences**

Use before/after & treatment/control differences to remove confounding

### Which is better or more credible? RCTs, quasi experiments, or DAG-based models?

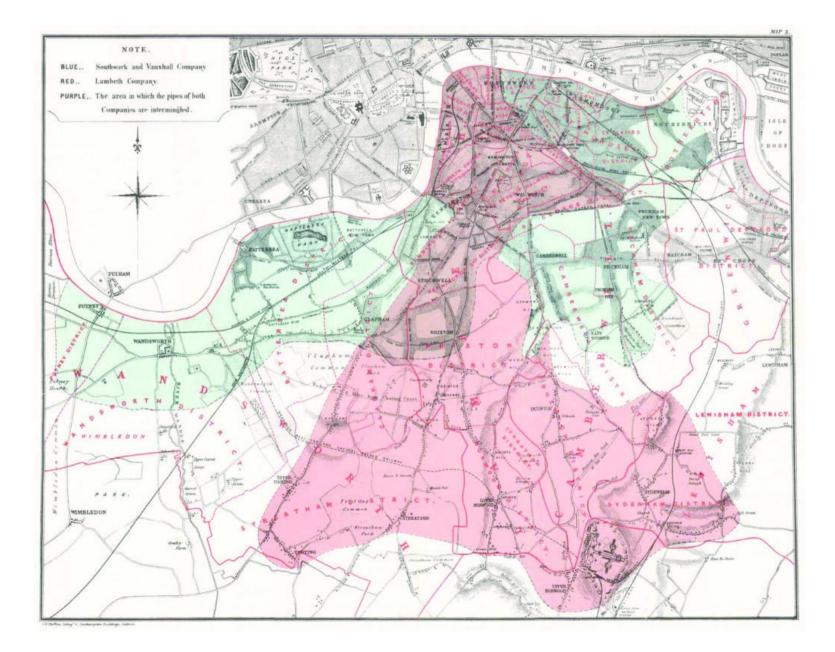

## Interactions and regression

# Can we talk more about interaction terms and how to interpret them?

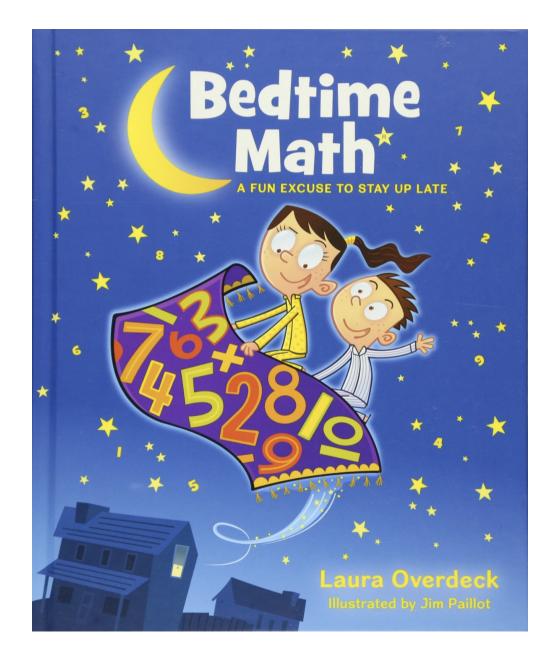

Are interaction effects in regression always more accurate of a difference than running a "regular" regression without them?

### Regression is just fancy averages!

## Simple diff-in-diff

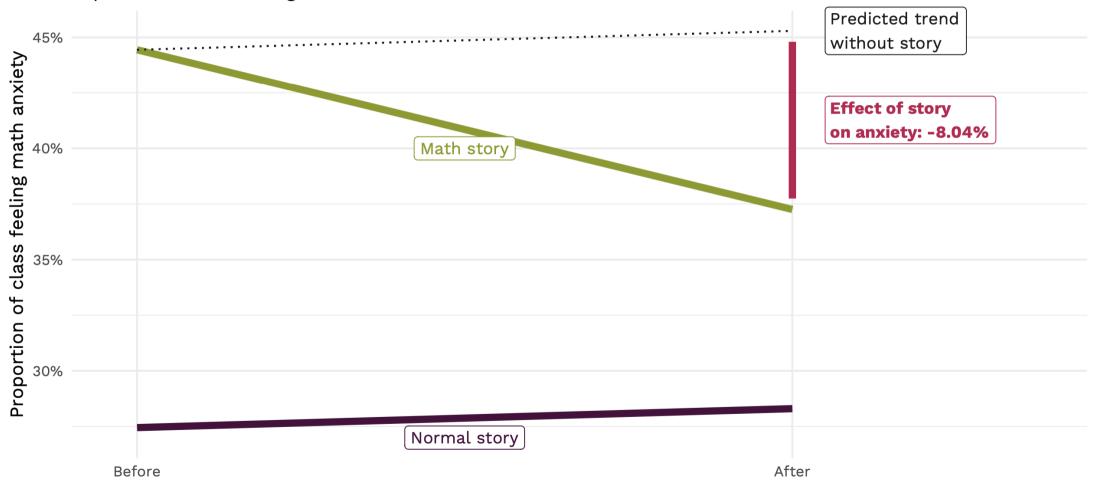

#### Reading a story about math reduces math anxiety

Experiment in four 4th grade classes

When doing your subtracting to get your differences in the matrix, is it better to do the vertical or horizontal subtractions?

> Are there situations where one is preferable to the other?

Why are we learning two ways to do diff-in-diff? (2x2 matrix vs. <code>lm()</code>)

### What happened to confounding??

### Now we're only looking at just two "confounders"?

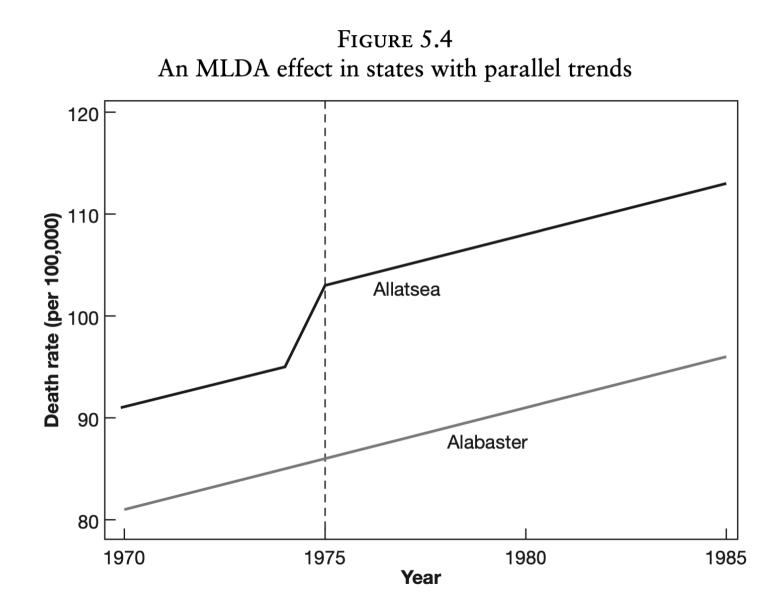

What group level is best for comparison? For example, if we are looking at policy change in NJ, is it best to compare with just one or two similar states? How similar do the populations need to be?

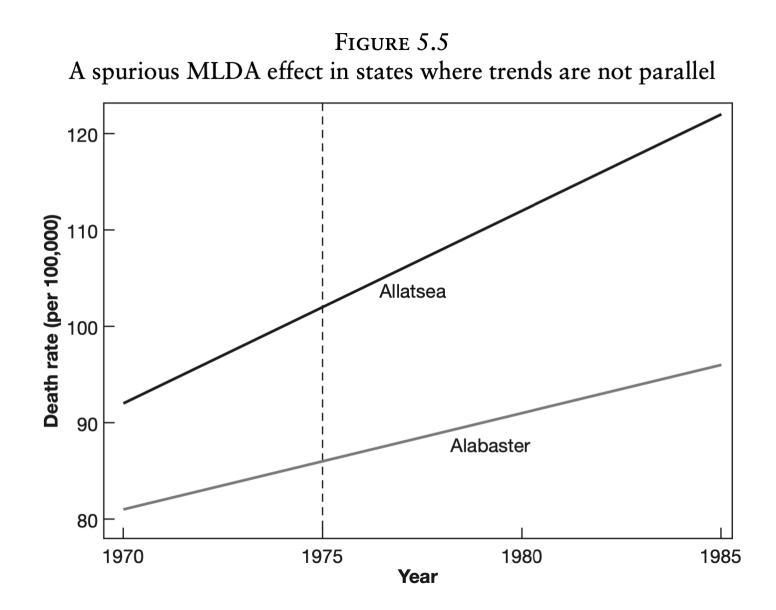

#### Wouldn't matching be better?

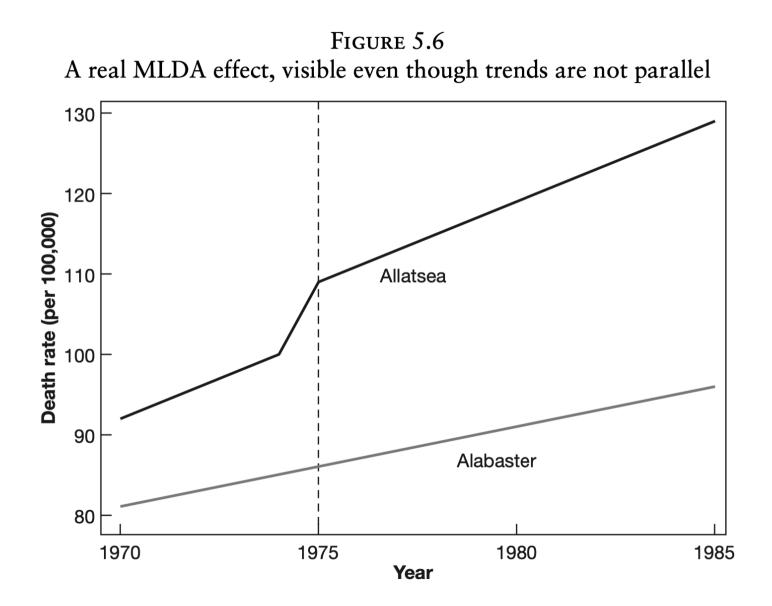

Do we have to think about balance when dealing with observational data in diff in diff?

**Two-way fixed effects (TWFE)** 

### Minimum legal drinking age

#### **MLDA reduction**

#### Two states: Alabama vs. Arkansas

## $egin{aligned} ext{Mortality} &= eta_0 + eta_1 ext{ Alabama} + eta_2 ext{ After 1975} + \ eta_3 ext{ (Alabama imes ext{ After 1975)} \end{aligned}$

#### **Organ donations**

#### Two states: California vs. New Jersey

 $egin{aligned} ext{Donation rate} &= eta_0 + eta_1 ext{ California} + eta_2 ext{ After Q22011} + \ eta_3 \ ( ext{California} imes ext{After Q22011}) \end{aligned}$ 

## Two-way fixed effects (TWFE)

#### Two states: Alabama vs. Arkansas

## $egin{aligned} ext{Mortality} &= eta_0 + eta_1 ext{ Alabama} + eta_2 ext{ After 1975} + \ eta_3 ext{ (Alabama imes ext{ After 1975)} \end{aligned}$

#### All states: Treatment == 1 if legal for 18-20-year-olds to drink

Mortality =  $\beta_0 + \beta_1$  Treatment +  $\beta_2$  State +  $\beta_3$  Year

## $\begin{array}{l} \text{Mortality} = \beta_0 + \beta_1 \text{ Alabama} + \beta_2 \text{ After 1975} + \\ \beta_3 \text{ (Alabama \times After 1975)} \end{array}$

#### VS.

Mortality =  $\beta_0 + \beta_1$  Treatment +  $\beta_2$  State +  $\beta_3$  Year

## $\begin{array}{l} \text{Mortality} = \beta_0 + \beta_1 \text{ Alabama} + \beta_2 \text{ After 1975} + \\ \beta_3 \text{ (Alabama \times After 1975)} \end{array}$

#### VS.

Mortality =  $\beta_0 + \beta_1$  Treatment +  $\beta_2$  State +  $\beta_3$  Year vs.

 $egin{aligned} ext{Mortality} &= & eta_0 + eta_1 ext{ Treatment} + eta_2 ext{ State} + eta_3 ext{ Year} + \ & eta_4 ext{ (State} imes ext{ Year)} \end{aligned}$ 

Dependent variable	(1)	(2)	(3)	(4)
All deaths	10.80	8.47	12.41	9.65
	(4.59)	(5.10)	(4.60)	(4.64)
Motor vehicle accidents	7.59	6.64	7.50	6.46
	(2.50)	(2.66)	(2.27)	(2.24)
Suicide	.59	.47	1.49	1.26
	(.59)	(.79)	(.88)	(.89)
All internal causes	1.33	.08	1.89	1.28
	(1.59)	(1.93)	(1.78)	(1.45)
State trends	No	Yes	No	Yes
Weights	No	No	Yes	Yes

 TABLE 5.2

 Regression DD estimates of MLDA effects on death rates

*Notes:* This table reports regression DD estimates of minimum legal drinking age (MLDA) effects on the death rates (per 100,000) of 18–20-year-olds. The table shows coefficients on the proportion of legal drinkers by state and year from models controlling for state and year effects. The models used to construct the estimates in columns (2) and (4) include state-specific linear time trends. Columns (3) and (4) show weighted least squares estimates, weighting by state population. The sample size is 714. Standard errors are reported in parentheses.

## $egin{aligned} ext{Donation rate} &= eta_0 + eta_1 ext{ California} + eta_2 ext{ After Q22011} + \ eta_3 \ ( ext{California} imes ext{After Q22011}) \end{aligned}$

VS.

# What about this staggered treatment stuff?

See this

## Sensitivity analysis

#### How do we know when we've got the right confounders in our DAG?

How do we solve the fact that we have so many unknowns in our DAG?
